<sup>2</sup>Oak Ridge Institute for Science and Education

<u>Definition Purpose</u>: To assist state, local, tribal, territorial, and federal public health practitioners in monitoring emergency department (ED) visits for suspected nonfatal overdoses involving any drug using syndromic surveillance data.

New or Revised Definition: Revision of All Drug Overdose v2

Date Added to ESSENCE: January 16, 2024

<u>Definition Description</u>: The CDC All Drug Overdose v3 Parsed syndrome definition was designed to be used to identify ED visits for suspected nonfatal drug overdoses of unintentional or undetermined intent. The query relies on data in two fields from ED visit records to identify encounters that meet the definition criteria:

- (1) the chief complaint free text field, which is a processed version of the reported chief complaint and may include terms indicating a drug overdose or poisoning, as well as relevant exclusion terms (e.g., terms indicating withdrawal without acute intoxication, etc., which would exclude ED visit records from this syndrome definition), and
- (2) the discharge diagnosis parsed field, which includes International Classification of Diseases, Clinical Modification, 9th Revision (ICD-9-CM), International Classification of Diseases, Clinical Modification, 10th Revision (ICD-10-CM), and/or Systematized Nomenclature of Medicine Clinical Terms (SNOMED-CT) diagnosis codes, with descriptive text removed, and which may indicate an acute drug overdose or poisoning of unintentional or undetermined intent.

Within ESSENCE, the syndrome query is applied to the Chief Complaint Discharge Diagnosis (CCDD) Parsed field, which combines these two fields of interest.

#### Use-Cases for Definition:

□ Case-finding

☑ Trend monitoring

## □ Early outbreak detection

<u>Justification for Development</u>: Fatal and nonfatal drug overdoses are at historic levels in United States.<sup>4</sup> This definition was developed to help public health practitioners track and understand overall trends of nonfatal drug overdoses treated in EDs in near real-time. These encompass drugs that are illegal and legal (prescription, over the counter, etc.).

#### **Data Source During Development: ED visits**

Development Methods: This revision was developed to serve three purposes: (1) Adapt the CDC All Drug Overdose v2 definition<sup>5</sup> syntax to query the newly developed CCDD Parsed field which removes extraneous text from the discharge diagnosis portion of CCDD, (2) nest the logic for CDC All Opioid Overdose v3 Parsed, All Stimulant Overdose v4 Parsed, and Benzodiazepine Overdose v2 Parsed definitions within the CDC All Drug Overdose definition to ensure capture of ED Visits for suspected drug overdoses by the All Drug Overdose definition, and (3) revise the query syntax to incorporate corrections to logic and other identified improvements. CDC NSSP staff used R code to update the syntax to meet CCDD Parsed field requirements. The CDC DOSE team reviewed the revisions and compared total visits captured by CCDD and CCDD Parsed versions of the definition, with a focus on diagnostic codes, to ensure correct restructuring.

The CDC All Drug Overdose v2 syntax was reorganized to place exclusion terms with the relevant inclusion terms and group terms drug and overdose terms within the definition. Cannabis terms were removed from query syntax during validation of the definition, as CDC scientists conducting the review determined that cannabis terms in the chief complaint field were associated with intoxication and not poisoning or overdose. The ICD-10-CM code for poisoning by cannabis, T40.711A, was kept. A limited set of synthetic cannabinoid terms, which were determined to be associated with poisonings and which could be present in the chief complaint field, were retained. Drug terms included in the now nested All Opioid Overdose v4 Parsed, All Stimulant Overdose v3 Parsed, and Benzodiazepine Overdose v2 Parsed syndrome definitions were removed from the main body of the All Drug Overdose syntax. The initial All Drug Overdose definition development began with the DOSE team reviewing guidance from the United States Drug Enforcement Administration (DEA), Council of State and Territorial Epidemiologists (CSTE), and the Substance Abuse and Mental Health Services Administration (SAMHSA). First, ICD-9-CM, ICD-10-CM, and SNOMED-CT diagnosis codes indicating an acute drug poisoning were identified; this was followed by overdose terms in the chief complaint text. Finally, drug terms indicating that any type of drug was involved in the overdose were added. The definition was developed to be inclusive of overdoses involving all drug types, including both illegal and prescription drugs.

<u>Validation Methods:</u> Three methods were employed to validate this new definition.

 CDC scientists from the NSSP team used R code to convert the syntax from (A) the previous All Drug Overdose versions that queried the Chief Complaint Discharge Diagnosis (CCDD) field to (B) syntax that would effectively query the Chief Complaint Discharge Diagnosis (CCDD) Parsed field. These conversions focused on changes to diagnostic code formatting within the syntax. The DOSE

<sup>&</sup>lt;sup>4</sup> Casillas S, Pickens CM, Tanz L, Vivolo-Kantor A. Estimating the ratio of fatal to nonfatal overdoses involving all drugs, all opioids, synthetic opioids, heroin, or stimulants, United States, 2010–2020. Injury Prevention 2023 (in press)

<sup>&</sup>lt;sup>5</sup> CDC All Drug Overdose v2: https://knowledgerepository.syndromicsurveillance.org/cdc-all-drug-v2

- team verified that the syntax converted correctly (i.e., did not eliminate codes or terms that were intended to capture stimulant-involved overdose).
- 2) The CDC DOSE team incorporated corrections and improvements to the syntax logic and piloted the draft definition by manually reviewing records that were captured after aforementioned conversion of syntax. This process was done iteratively with the proposed changes and the DOSE team met and discussed visit reviews and incorporated the inclusion and exclusion terms. Terms that were associated with ED visits classified in review as true suspected overdoses were retained.
- 3) The DOSE team evaluated the draft definition by comparing overdose counts and reviewing records that were captured before and after aforementioned conversion of syntax. Overall aggregate counts over time comparing CDC All Drug Overdose v2 and CDC All Drug Overdose v3 Parsed showed only minimal differences in counts, which were an anticipated outcome of the syntax conversion process.

<u>Definition Fields & Structure</u>: The CCDD Parsed field is used to query both the Discharge Diagnoses Parsed and Chief Complaint Free Text fields.

- Automatic inclusion:
  - The ED visit is automatically included in the syndrome definition if the ED visit includes:
    - If a diagnosis code indicating an acute unintentional or undetermined intent drug poisoning is present, and/or
    - Mention of overdose in the chief complaint text.
  - The ED visit is automatically included in the syndrome definition if the ED visit meets one or more of the nested drug overdose definitions:
    - CDC All Opioid Overdose v3 Parsed
    - CDC All Stimulant Overdose v4 Parsed
    - CDC Benzodiazepine Overdose v2 Parsed
- Conditional inclusion:
  - If the ED visit does not include a diagnosis code for drug poisoning of unintentional or undetermined intent, an overdose term, or meet the criteria for one or more of the nested drug overdose definitions, the visit is captured only if it includes two components and no exclusion terms:
    - 1) chief complaint text indicating an overdose or poisoning, AND
    - 2) chief complaint text indicating drug involvement
  - The exclusion terms are applied to the chief complaint text only when the automatic inclusion criteria are not met.

<u>For Consideration</u>: First, the CDC All Opioid Overdose v4 Parsed, CDC All Stimulant Overdose v4 Parsed, and CDC Benzodiazepine Overdose v2 Parsed syndrome definitions are nested within the All Drug Overdose v3 Parsed syndrome definition; thus, everything included in those queries and their associated sub-queries (Heroin and Fentanyl are sub-queries for All Opioid; Methamphetamine and Cocaine are sub-queries for All Stimulant) are also included in the All Drug Overdose v3 Parsed syndrome definition. Second, many drug names included in this version of the definition with necessary exclusions (e.g., "PCP" is a drug but also an abbreviation used for "primary care physician"). Third, the DOSE team identified drug names, including popular brand or slang terms, that were found in chief complaint text and will routinely review this syndrome definition to identify any additional drug names and slang terms to add to a future version of the definition. This is especially true as new drugs enter the market.

<u>Limitations:</u> This definition was developed to capture suspected nonfatal drug overdoses treated in EDs. However, it is subject to both misclassification and under/overreporting for several reasons, including

limited point-of-care confirmatory testing to identify the drug(s) involved in the overdose and reliance on self-report, bystander reports, and/or clinical presentations to determine the drug(s) involved in an overdose. The codes provided in the discharge diagnosis field from the ED visit record do not necessarily represent the final diagnosis of a patient and should be considered preliminary. Additionally, some hospitals may enter all diagnosis codes on a patient's entire medical history that are not indicative of the current visit, thus resulting in overreporting if codes for historical drug use/abuse/dependence are included. Signs and symptoms of drug overdose may present differently depending on the drug(s) used; however, this revision decreases the potential impact of this limitation by nesting sub-queries in the All Drug Overdose v3 Parsed syndrome definition instead of merging all sub-query terms into syndrome definition syntax. It is not possible in syndromic data to determine the primary reason for a patient's visit, as syndromic data lack a primary diagnosis field. Therefore, all terms and codes are considered equally (i.e., not in any priority) regardless of what order they are in the record. For some records with multiple descriptions and codes of symptoms and diseases, it may not be possible to determine the exact reason why a patient has entered care at an ED; it is dependent on the chief complaint terms and discharge diagnosis codes provided. For example, someone with shortness of breath and drug use may have been treated at an ED for asthma symptoms and used a prescription opioid as directed. This scenario could be captured as a drug overdose; however, these records were relatively uncommon. Future studies where provider triage notes are available may help validate the use of chief complaints and discharge diagnoses to identify drug overdose visits in syndromic data.

<u>Acknowledgements:</u> The CDC DOSE team would like to acknowledge the contributions of CDC NSSP staff members Zach Stein, Michael Sheppard, and Mukesh Hamal in recoding the query to the CCDD Parsed field and reviewing the query revisions.

### **Detailed Definition Components**
